PROJECT HELM

Governing Amendment v1.1

Crew Lifecycle, Captain Succession, and Muster Experience

Amendment to the Project Helm v1.0 Governing Architecture and Product Requirements Document

GOVERNING PRINCIPLE

A shared Voyage may never continue in playable active operation without exactly one active Captain authority. Crew membership, Captain authority, cancellation, succession, and solo continuation must be explicit, history-preserving, transactionally safe, and understandable from the product surface. A Player may leave; a Captain may relinquish; the crew may continue; and any Player may create a solo continuation without corrupting the original shared Voyage.

Version 1.1 | August 13, 2026

Status: Governing amendment to Project Helm v1.0

Document Control

Field	Value
Program	Project Helm
Subsystem	Captain Operations and Participating-Captain System
Document type	Formal governing amendment to Version 1.0
Amendment version	1.1
Prepared	August 13, 2026
Status	Governing amendment
Baseline authority	Project Helm v1.0 remains authoritative except where this amendment explicitly adds or modifies requirements.
Revision focus	Crew lifecycle, Captain succession, voluntary exit, cancellation, solo continuation, zero-invite solo creation, and Waiting Room / muster completion.
Sequence effect	Insert A1, A2, and A3 after accepted Phase 2 and before Phase 3. Original Phases 3-5 retain their names, numbering, and original governed scope.
Primary surfaces	Player Library, invitation flow, Captain Library, Captain Voyage Console, crew management, Waiting Room, Player runtime entry, historical projections.
Core implementation rule	Helm orchestrates lifecycle through canonical One Voyage / Platform membership and authority services. It does not create a second progression engine or shadow Voyage state.
Development rule	A1, A2, and A3 are independently mainline-safe delivery boundaries. No supplemental stack may be built on an unmerged predecessor.

Amendment Precedence

This amendment supplements the Version 1.0 governing document. All Version 1.0 principles, ownership boundaries, privacy rules, command semantics, testing requirements, and original phase definitions remain in force unless this amendment explicitly states otherwise.

NO PHASE HIJACKING

Phase 3 remains Give the Orders. Phase 4 remains Weather the Passage. Phase 5 remains Clear for Voyage. This amendment creates three supplemental delivery boundaries because owner walkthrough exposed a missing lifecycle plateau that must exist before the planned command, recovery, and final-polish phases can proceed cleanly.

1. Executive Summary

Core Product Outcome

A person must be able to join, decline, leave, continue solo, take Captaincy, transfer Captaincy, or end a Voyage through explicit, comprehensible, history-preserving product flows. A Captain must be able to understand exactly who is invited, who has joined, who is present, who is ready, and what relationship each person currently has to the Voyage.

Project Helm v1.0 correctly established that Captain authority and Player participation are independent dimensions. It also established participant management, crew operational projection, waiting-room coordination, recovery, and future Captain transfer as part of Helm's architectural territory. The first real owner walkthrough after Phase 2 exposed that several ordinary lifecycle journeys were still underspecified or absent: a Player could leave a screen without actually leaving a Voyage; the Captain had no complete crew-management experience; Captain transfer had no governed succession model; solo creation still effectively required an invitee; and the Waiting Room presented role-blind copy to a participating Captain.

Those gaps are not appropriate additions to Phase 3, because Phase 3 is already governed as the contextual command-console phase. They are also too fundamental to defer to Phase 4 recovery or Phase 5 final polish. This amendment therefore inserts three independently mergeable supplemental delivery boundaries between Phase 2 and Phase 3.

Delivery boundary	Primary purpose	Permanent-stop result	Original phase impact
A1 - Muster the Crew	Complete ordinary invitation, membership, exit, removal, cancellation, and crew-roster lifecycle.	A coherent Voyage can be created solo or with crew; membership can begin and end safely; Captains can manage the crew without A2/A3.	Does not implement command-console scope, Captain succession, or the full Waiting Room redesign.
A2 - Pass the Helm	Make Captain authority transferable and govern vacancy, succession, and solo continuation.	Captaincy can move safely; a Player can fork a solo continuation; shared progression cannot continue without one Captain.	Does not implement Phase 3 command vocabulary or Phase 4 degraded-provider recovery.
A3 - Ready the Room	Turn the Waiting Room into a role-aware, live crew muster and launch experience.	The pre-launch gathering experience is polished and truthful, with placeholders ready for future Figurehead avatars.	Does not implement Figurehead itself or final Project Helm closure polish.

2. Why This Amendment Exists

The amendment is triggered by product reality, not by a desire to reshuffle the roadmap. The Version 1.0 design already anticipated participant removal, invitation lifecycle, crew readiness, waiting-room coordination, and a future scoped Captain-transfer contract. The missing piece was a complete behavioral contract tying those concepts together into ordinary human journeys.

2.1 Walkthrough findings that require governed closure

- Invitation decline exists but is not sufficiently discoverable from the Player Library.
- Leaving the Waiting Room does not mean leaving the Voyage; the product needs a true voluntary membership-exit action.
- Captain crew state is visible only in fragmented or low-fidelity forms rather than one clear Crew & Invitations experience.
- Removing an accepted Player from the crew needs a governed, confirmed, history-preserving mutation and immediate access revocation.
- Cancelling a Voyage for everyone needs explicit terminal semantics distinct from relinquishing Captaincy.
- Captain authority transfer needs an atomic, auditable lifecycle contract rather than being inferred from crew role.
- A Captain vacancy requires a governed succession state and a clear path for remaining Players.
- Continue Solo needs to be a first-class action that creates a safe personal fork rather than mutating the shared Voyage.
- Captain + Player creation must support zero invited crew members.
- The Waiting Room must recognize when the current Player is also the Captain and must not tell the Captain to wait for themselves.
- The Waiting Room needs a substantial product-quality overhaul before future avatar embodiment arrives through Project Figurehead.

2.2 What this amendment deliberately does not do

- It does not renumber or replace the original five phases.
- It does not move Phase 3 command-console work earlier.
- It does not absorb Phase 4 provider, preflight, degraded-operation, or broad recovery scope.
- It does not prematurely implement Project Figurehead.
- It does not create a second One Voyage progression or membership model.
- It does not move account suspension, platform administration, or support powers into Helm.

3. Relationship to the Version 1.0 Governing Baseline

Version 1.0 remains the architectural constitution for Project Helm. This amendment deepens several already-governed areas rather than creating an unrelated subsystem.

Version 1.0 area	Existing governed intent	Amendment refinement
Captain participation modes	Captain-only and Captain+Player remain independent.	Zero-invite Captain+Player creation becomes explicitly supported.
Crew Operational Projection	Show membership, presence, readiness, sync, safe state.	Unify invited and joined relationships into one actionable Crew & Invitations presentation.
Launch / Waiting Room	Show crew readiness and coordinate launch; participating Captain may enter as Player.	Add role-aware Captain copy, direct launch affordance, live seat/presence presentation, and explicit leave-vs-exit semantics.
Participant Lifecycle Management	Invite, replace, remove, re-invite; Captain transfer reserved as future scoped contract.	Fully govern voluntary leave, removal, cancellation, transfer, relinquishment, succession, and history.
Recovery and Reconciliation	Participant loss and reconciliation are first-class.	Move ordinary predictable lifecycle out of Phase 4 so Phase 4 can focus on exceptional recovery.
Mainline Integration	Each Helm phase independently enters main.	A1, A2, and A3 obey the same rule and must not stack.

UNCHANGED CORE BOUNDARY

Captain authority and Player membership remain orthogonal. Removing one never silently removes the other. Player-safe projections remain Player-safe even when the same authenticated person is the Captain.

4. Revised Delivery Sequence

The effective Project Helm delivery sequence becomes the following. Supplemental increments are labeled A1-A3 to preserve the original phase numbering and historical records.

Order	Delivery boundary	Status / purpose
1	Phase 1 - Take the Helm	Participating-Captain foundation
2	Phase 2 - Read the Deck	Operational projections and crew intelligence
3	A1 - Muster the Crew	Ordinary crew lifecycle and cancellation
4	A2 - Pass the Helm	Captain succession and solo continuation
5	A3 - Ready the Room	Muster / Waiting Room product completion
6	Phase 3 - Give the Orders	Contextual Captain command console
7	Phase 4 - Weather the Passage	Preflight, recovery, degraded modes
8	Phase 5 - Clear for Voyage	Final integration, accessibility, polish, closure

4.1 Supplemental sequencing rule

PARALLEL PROJECTS, NO HELM STACK

A2 may not start until A1 is accepted in protected main. A3 may not start until A2 is accepted in protected main. Phase 3 may not start until A3 is accepted in protected main. Other projects may continue in parallel subject to their normal ownership boundaries.

If main advances while a supplemental increment is active, that increment must reconcile the current accepted main, determine invalidated evidence through Sounding Line, refreeze one candidate, and then enter the normal protected-main acceptance lane.

5. New Non-Negotiable Lifecycle Invariants

Invariant	Required behavior
Exactly one Captain during active shared play	Every playable ACTIVE shared Voyage has exactly one active Captain authority. If authority becomes vacant, shared progression enters a governed CAPTAIN_REQUIRED hold until authority is restored or remaining Players choose solo/exit outcomes.
Cancellation is not relinquishment	Cancel Voyage for Everyone terminates the shared Voyage as non-playable history. Relinquish Captaincy attempts to preserve the shared Voyage through succession.
Membership exit preserves history	Decline, voluntary leave, removal, and cancellation do not delete historical membership or accepted lifecycle facts.
Captain authority is transferable only explicitly	Captaincy may never be inferred from crew role, presence, invitation ownership, or being the last remaining Player.
First committed succession wins	Concurrent takeover attempts are resolved transactionally. Exactly one accepted Captain authority assignment may result.
Continue Solo never mutates the shared Voyage	Solo continuation creates a new Voyage lineage from the latest committed safe state. The shared Voyage and other Players remain unchanged.
Continue Solo is ordinarily available	Any eligible non-terminal Player may create a solo continuation unless already the sole Captain+Player of that same continuation. During transient reconciliation, the action may wait for an exact committed source state rather than disappearing.
Zero-invite solo creation is valid	A Captain+Player may create a Voyage with no additional crew invitations.
UI language follows actual role	Participating Captains must never be shown copy that falsely implies a separate Captain must arrive.
Lifecycle actions are server truth	The UI may preview and confirm, but membership, authority, cancellation, succession, and fork outcomes come only from canonical committed receipts.

6. Canonical Lifecycle Vocabulary

The implementation may adapt exact enum names to current repository conventions, but the product must preserve the following semantic distinctions.

Term	Meaning
Invitation Decline	Recipient explicitly refuses a pending invitation. The invitation is terminal and visible as declined history.
Voluntary Leave	An accepted Player ends current membership in a non-terminal Voyage while preserving historical participation.
Crew Removal	Captain-authorized removal of another Player from the active/shared Voyage under policy.
Captain Relinquishment	Current Captain intentionally gives up Captain authority without choosing to cancel the shared Voyage.
Captain Transfer	Atomic change from one Captain authority holder to another eligible joined Player.
Succession Hold	Non-playable shared state used when a Captain vacancy exists and no new Captain has yet committed.
Take Captaincy	Eligible Player accepts shared Voyage Captain authority and becomes Captain+Player.
Continue Solo	Creates a new personal Voyage from the latest safe committed state, with the requesting Player as Captain+Player.
Voyage Cancellation	Explicit terminal action that archives the shared Voyage as cancelled and non-playable for all participants.
Fork Lineage	Durable relationship between the original shared Voyage and a derived solo continuation.
Muster	The role-aware pre-launch gathering state where invited/joined crew, readiness, presence, Captain identity, and launch status are visible.

7. Supplemental A1 - Muster the Crew

A1 Mission

Complete the ordinary lifecycle of invitations and Player membership before introducing Captain succession. A1 answers: Who is part of this Voyage, how did they get here, how may they leave, how may the Captain remove them, and what happens when the Captain ends the entire shared Voyage?

7.1 In scope

- Expose Accept / Decline invitation actions directly from the ordinary Player Library or equivalent discoverable invitation card.
- Preserve the richer invitation ceremony when the user opens an invitation, but do not require opening it merely to decline.
- Permit Captain+Player Voyage creation with zero additional crew invitations.
- Replace the mandatory initial blank crew row with an optional Add Crew member workflow.
- Create one unified Captain Crew & Invitations projection and interface that includes pending invitations and accepted/current Players.
- Distinguish invitation, membership, presence, readiness, sync, and role rather than flattening them into one status string.
- Add true Player Leave Voyage behavior before and after launch where policy permits.
- Add Captain Remove from Crew behavior with consequence confirmation and immediate access invalidation.
- Add Cancel Voyage for Everyone as explicit terminal shared-Voyage action.
- Preserve history and source-bound audit records for every lifecycle transition.
- Update Player/Captain realtime projections immediately after membership changes.

7.2 Explicit A1 non-goals

- No Captain transfer or succession yet.
- No solo-continuation fork yet.
- No Phase 3 command-console redesign.
- No full Waiting Room visual overhaul beyond fixes required for truthful A1 actions.
- No account suspension/deletion or platform admin operations.

8. A1 Crew and Invitation Experience

The Captain should not have to mentally combine a separate Invitations tab, a comma-separated accepted-Player list, and presence indicators from another surface. A1 introduces one coherent operational crew view while preserving the separate authority of invitation, membership, and presence services.

Person	Relationship	Membership	Presence	Readiness	Actions
Sera	Player	ACTIVE	CONNECTED	READY	Remove / later Transfer
Snow	Player	ACTIVE	OFFLINE	JOINED	Remove / later Transfer
Nick	Invited	NONE	N/A	PENDING	Revoke / Replace / Extend
Kato	Captain + Player	ACTIVE	CONNECTED	READY	Player participation settings

8.1 Required crew projection fields

- Profile-safe identity: display name and avatar/initial where permitted.
- Invitation state when a pending invitation exists.
- Current membership state and historical terminal reason where relevant.
- Crew role independently from Captain authority.
- Presence and synchronization from authenticated presence evidence only.
- Readiness and launch blockers.
- Whether the person is the current Captain.
- Which lifecycle actions are currently valid and why an action is unavailable.

8.2 Invitation discoverability

A pending invitation must appear as a first-class actionable card. Accept and Decline are ordinary lifecycle choices, not hidden developer knowledge. Decline requires clear confirmation because it closes the invitation; the Captain sees the authoritative response after commit.

9. A1 Voluntary Exit, Removal, and Cancellation

9.1 Player Leave Voyage

Leave Voyage ends the Player membership relationship. It is distinct from Leave Waiting Room, Close, Back, or Return to Library. Navigation controls leave a page; Leave Voyage changes canonical membership.

- Preserve membership history, join timestamp, prior participation facts, and safe historical progress.
- Revoke current Player access after the committed leave receipt.
- Open tabs receive an access-revoked or membership-ended realtime event and transition to a safe explanation screen.
- If the leaving Player is also the Captain, A1 alone must refuse an authority-breaking leave and direct the person to the later governed relinquishment flow. Captain authority must not vanish as a side effect.

9.2 Captain Remove from Crew

Destructive Confirmation

Removing a Player immediately ends their current access to this shared Voyage. Their existing history is preserved. Rejoining requires a new governed invitation or other explicitly supported membership path.

Removal is not account suspension. It is scoped to one Voyage. The mutation must be server-authorized, audited, idempotent under retry, and safe under two Captain devices acting concurrently.

9.3 Cancel Voyage for Everyone

Cancellation is an explicit terminal non-completion state. It ends shared play for every participant, preserves historical records, invalidates active progression entry, and moves the Voyage to archived/non-playable history. It does not trigger Captain succession because the Captain has chosen to end the shared Voyage itself.

- High-risk confirmation must name the Voyage and explain that all current participants will lose active access.
- Pending invitations become terminal according to the owning invitation contract.
- Active Players receive a realtime cancellation notification and safe exit state.
- Cancelled Voyages remain visible in authorized history with cancellation reason/category when governed, but are not resumable as the same Voyage.
- Creating a new Voyage or a later fork is a distinct action with new identity.

10. A1 Mainline Safety and Acceptance

10.1 Mainline Safety Contract

Field	A1 contract
Starting prerequisite	Helm Phase 2 accepted in protected main; current main reconciled before final authority.
What exists after A1	Discoverable invitation decisions, optional zero-invite creation, unified crew/invitation view, true voluntary leave, Captain removal, shared Voyage cancellation.
What remains unfinished	Captain transfer/succession, solo fork, full Waiting Room redesign, original Phase 3-5 scope.
Activation state	Fully active ordinary lifecycle behavior.
Backward compatibility	Existing invitation/revoke/launch and Captain participation behavior remains valid.
Permanent-stop test	If Project Helm stopped after A1, ordinary crew membership can be created, inspected, ended, and cancelled coherently without requiring A2.
Acceptance boundary	Focused membership/invitation/browser proof, authorization/privacy/idempotency/realtime evidence, exact migrations if any, Sounding Line Mainline Decision, protected merge, exact-main proof.

10.2 Mandatory A1 acceptance journeys

1. Create Captain+Player Voyage with zero invitees and launch eligibility behaves truthfully.
2. Create shared Voyage with invitees; accept and decline directly from Player surfaces.
3. Player voluntarily leaves before launch and after launch; history remains; access ends.
4. Captain removes a Player; their open waiting/runtime tab receives authoritative revocation.
5. Captain cancels a shared Voyage; all participants receive terminal state and the Voyage becomes archived/non-playable.
6. Two Captain devices attempt the same removal/cancel operation and converge on one authoritative result.

11. Supplemental A2 - Pass the Helm

A2 Mission

Make Captain authority a transferable, explicit, source-bound Voyage relationship. A2 ensures the shared Voyage can continue when a Captain leaves, while preserving the invariant that playable shared progression always has exactly one Captain.

11.1 In scope

- Explicit transfer of Captain authority to an eligible joined Player.
- Captain relinquishment without cancelling the Voyage.
- Succession hold when Captain authority becomes vacant through governed exit or unexpected authority loss.
- Take Captaincy action for eligible remaining Players.
- First-committed-wins concurrency protection for simultaneous succession acceptance.
- Continue Solo available to eligible Players throughout ordinary non-terminal play.
- Fork lineage and exact committed-source state cloning into a new personal Voyage.
- Clear Player choices when no one assumes shared Captaincy: Take Captaincy, Continue Solo, or Leave Voyage.
- Audit/history projections for transfers, relinquishment, succession, and fork lineage.

11.2 Explicit A2 non-goals

- No broad Phase 4 degraded-provider recovery.
- No platform-admin forced reassignment from Helm.
- No hidden automatic Captain assignment.
- No merging independently forked solo continuations back into the shared Voyage.
- No new Chronicle authoring rules.

12. Captain Transfer and Relinquishment

12.1 Direct transfer

A current Captain may select an eligible joined Player and transfer Captain authority. The recipient becomes Captain + Player because they already hold Player membership. Transfer must be atomic: the old authority ends only as the new authority commits, with one authoritative transfer receipt.

- Eligibility is server-derived from current Voyage membership and policy.
- Presence may influence which candidates are recommended but must not define eligibility unless policy explicitly requires online acceptance.
- Transfer never changes the pinned Chronicle edition, runtime progression, membership, artifacts, or private Player data.
- The former Captain may remain a normal Player if they have Player membership.
- Both old and new Captain interfaces reconcile immediately from authoritative state.
- A transfer receipt identifies prior Captain, new Captain, Voyage, timestamp, source revision/sequence, and safe reason metadata.

12.2 Relinquishment

Relinquishment means: I am giving up Captain authority, but I am not cancelling the shared Voyage. The product should encourage a direct transfer first. If no recipient is chosen or available, the Voyage enters Succession Hold.

IMPORTANT DISTINCTION

Cancel Voyage for Everyone terminates the shared Voyage. Relinquish Captaincy preserves it if the crew can establish a new Captain. These controls must never share ambiguous labels or confirmation copy.

13. Succession and Captain Vacancy

A shared Voyage with no Captain may exist only as a non-progressing succession hold. It must not continue ordinary shared progression while authority is undefined.

13.1 Succession Hold behavior

- Pause or block Captain-dependent/shared progression according to canonical One Voyage policy without fabricating a pause event if a distinct hold contract is appropriate.
- Notify eligible joined Players that Captaincy is vacant.
- Present the same authoritative candidate state across devices.
- Keep Player-safe story state readable where policy permits, but prevent actions that require Captain authority.
- Expose an explicit deadline only if a real policy defines one; do not invent countdown pressure.
- Remain recoverable after refresh, reconnect, or server restart.

13.2 Player choices during succession

Choice	Outcome	Shared Voyage effect
Take Captaincy	This Player becomes Captain+Player for the shared Voyage.	Succession hold ends; shared Voyage continues.
Continue Solo	Create a new personal fork with this Player as Captain+Player.	Original shared Voyage remains unchanged and may still await a Captain.
Leave Voyage	End this Player's membership and preserve history.	Shared Voyage remains awaiting resolution for others.

13.3 Concurrency rule

FIRST COMMITTED TAKEOVER WINS

If multiple Players attempt to take Captaincy, one transaction commits against the expected authority/revision. Other attempts receive a stale/conflict result, refetch, and see the new Captain. The interface must never briefly present two Captains as authoritative.

14. Continue Solo and Fork Lineage

Continue Solo is not merely an emergency escape from succession. It is a general Player capability for leaving a multiplayer path without abandoning the Chronicle. An eligible Player may create a personal continuation from the latest committed safe state of the shared Voyage.

14.1 Fork contract

- Create a new Voyage identity. Never transform the shared Voyage into the solo Voyage.
- Bind the new Voyage to the exact same immutable published Chronicle edition unless a separate explicit replay/edition-selection flow is chosen.
- Clone only canonical committed progression state that the owning One Voyage service defines as safe to continue.
- Do not clone another Player's private reflections, private memories, private notes, credentials, or unrelated personal state.
- The requesting Player becomes Captain+Player in the new Voyage.
- Preserve parent Voyage ID, source sequence/revision, fork timestamp, and safe lineage metadata.
- The original shared membership remains unchanged by default; the Player may separately leave the shared Voyage if desired.
- If the shared Voyage is in a transient reconcile/write operation, the action may temporarily show Synchronizing before forking from a stable committed state.

14.2 Availability rule

Continue Solo should be offered throughout non-terminal Player participation, not only after a Captain leaves. It is unnecessary only when the person is already the sole Captain+Player of a solo continuation, or when the Voyage is terminal. Chronicle policy may constrain copying of specific provider-dependent state, but the product must explain any temporary or permanent restriction rather than silently hiding the action.

15. A2 Mainline Safety and Acceptance

Field	A2 contract
Starting prerequisite	A1 accepted in protected main.
What exists after A2	Atomic Captain transfer, relinquishment, succession hold, player takeover, always-available solo continuation/fork, lineage history.
What remains unfinished	Waiting Room overhaul and original P3-P5 scope.
Activation state	Fully active authority lifecycle and solo continuation.
Backward compatibility	Captain-only and Captain+Player mode remain valid; A1 lifecycle remains unchanged.
Permanent-stop test	If Project Helm stopped after A2, a shared Voyage can survive Captain departure without undefined authority, and any Player can continue privately without corrupting shared truth.
Acceptance boundary	Authority/membership transaction tests, stale/concurrent takeover tests, fork determinism and privacy proof, restart/reconnect proof, browser journeys, Sounding Line protected acceptance.

15.1 Mandatory A2 acceptance journeys

7. Current Captain transfers authority to a joined Player; old Captain remains Player; new Captain receives Captain controls only in Captain projection.
8. Captain relinquishes without a chosen successor; crew receives succession hold and choices.
9. Two Players attempt Take Captaincy simultaneously; exactly one commits.
10. Player selects Continue Solo during healthy shared play; new Voyage starts at exact committed state and shared Voyage is unchanged.
11. Two Players independently Continue Solo; two separate forks exist with no shared-Captain invariant violation.
12. Refresh/reconnect during succession restores the exact authoritative candidate and Captain state.

16. Supplemental A3 - Ready the Room

A3 Mission

Make the Waiting Room feel like a real crew gathering rather than a passive status card. The surface must be role-aware, live, polished, accessible, and prepared to accept richer Figurehead avatar embodiment later without changing its lifecycle semantics.

16.1 In scope

- Role-aware copy for ordinary Player, Captain-only observer, and Captain+Player participant contexts.
- Participating Captain must see Ready when you are, Captain or equivalent truthful language rather than Awaiting Captain.
- Expose Launch Voyage from the participating Captain's Waiting Room when launch is permitted.
- Present invited seats, joined Players, ready Players, current Captain, and open/optional crew positions clearly.
- Animate live joins, departures, readiness transitions, Captain transfer, and launch state through Lanternwake-owned motion contracts.
- Show planned start/countdown, connection state, last server confirmation, and blockers without overwhelming the room.
- Provide clear crew options and clear separation between Leave Waiting Room, Leave Voyage, Continue Solo, and Captain actions.
- Support desktop, tablet, and phone layouts without horizontal page overflow.
- Prepare semantic avatar slots for future Project Figurehead while using current safe avatar/initial/fallback data.

16.2 Explicit A3 non-goals

- No Figurehead animation/model generation itself.
- No new Captain command console beyond launch and lifecycle actions already governed.
- No Phase 4 recovery drawer expansion.
- No final Project Helm visual closure beyond the muster/waiting surfaces.

17. Waiting Room / Muster Experience

The Waiting Room is a transitional social-operational space. It should communicate that a group is assembling, who is present, who is still invited, who is ready, who is Captain, whether launch is possible, and what the current user may do next.

17.1 Recommended information hierarchy

- 13. Chronicle title, Voyage name, exact edition, and lifecycle state.
- 14. Crew muster row/grid with profile-safe avatar/initial, name, role, readiness, and presence.
- 15. Captain identity and current-user relationship: Player, Captain, or Captain+Player.
- 16. Launch readiness or exact blockers.
- 17. Planned start and synchronized countdown when one exists.
- 18. Connection / reconciliation status and last server confirmation.
- 19. Primary action appropriate to the current user.
- 20. Secondary lifecycle options behind deliberate menus or confirmation surfaces.

17.2 Role-aware primary actions

Current relationship	Primary waiting-room message	Primary action
Ordinary Player	Waiting for Captain / Crew assembling	Wait / Reconnect / Player lifecycle options
Captain + Player	Ready when you are, Captain	Launch Voyage when permitted
Captain only	Crew is assembling	Return/Open Captain controls; launch from Captain surface
Succession hold Player	This Voyage needs a Captain	Take Captaincy / Continue Solo / Leave

17.3 Live behavior

The room should retain the durable polling/realtime reconciliation model already established by Helm. Visual arrival effects are secondary to authoritative membership/presence state. A join animation may celebrate a newly committed membership; it may not invent that the person joined before the server says so.

18. Figurehead-Ready Presence and Role-Aware Presentation

18.1 Figurehead-ready slots

A3 should define a stable semantic avatar slot for each crew participant. Today the slot may render a profile image, safe fallback illustration, or initials. Future Project Figurehead work may replace the visual embodiment inside that slot without changing membership, presence, readiness, Captain identity, or accessibility semantics.

- Figurehead integration must consume the crew projection; it must never become a new presence authority.
- Avatar animation never hides name, role, readiness, or status text.
- Avatar failure falls back immediately to profile-safe initials or static imagery.
- Reduced motion uses a settled static presence state rather than removing the participant from the room.
- No biometric inference, face tracking, or speculative emotional state is introduced by this amendment.

18.2 Accessibility and responsive requirements

- Every crew seat has a meaningful accessible name including person, role, and readiness/state where useful.
- New joins and Captain changes use bounded live-region announcements; routine heartbeat updates do not spam assistive technology.
- Keyboard focus order follows title -> crew -> status -> primary action -> secondary options.
- At 200% zoom and common phone widths, essential crew status and actions remain usable without horizontal page scroll.
- Color, animation, and avatar appearance never carry status meaning alone.
- Destructive actions return focus predictably after confirmation/cancellation.

19. Data, Service, and API Contract Additions

The amendment does not require one specific table layout. It requires canonical facts and narrow service contracts. Existing One Voyage, Platform membership, invitation, audit, and scoped authority structures should be extended before new persistence is invented.

19.1 Preferred authoritative facts

Concept	Preferred authority / persistence
Player membership and terminal reason	Existing PlaythroughMembership or canonical equivalent, preserving history.
Captain authority	Existing scoped resource authority if it can express transfer/revocation/history; otherwise the smallest dedicated assignment model.
Captain transfer/relinquishment history	Canonical authority event/audit plus optional typed transfer receipt.
Voyage cancellation	Canonical TaleSession/Voyage lifecycle transition and event.
Succession hold	Canonical lifecycle/authority projection or minimal explicit state only if One Voyage requires persistence.
Solo fork lineage	New Voyage identity plus immutable parent/source linkage and source sequence/revision.
Crew projection	Derived purpose-limited view over invitation, membership, authority, presence, readiness, and safe profile data.
Muster presentation	UI state derived from canonical projections; no shadow HelmState blob.

19.2 Representative endpoint families

Exact paths may adapt to current repository conventions. The behavior must remain narrow and typed rather than becoming a generic patch-Voyage endpoint.

Capability	Representative contract
Player invitation decision	Accept / Decline pending invitation through canonical invitation service.
Player leave	POST equivalent for voluntary current-membership exit.
Player continue solo	POST equivalent that creates a source-bound personal fork.
Captain crew projection	GET equivalent that returns unified invitations + membership + authority + presence/readiness view.
Captain remove member	POST/DELETE-style governed membership removal with expected revision/idempotency.
Captain cancel Voyage	POST governed terminal cancellation.
Captain transfer	POST governed authority transfer to eligible membership.
Captain relinquish	POST governed authority relinquishment that enters succession only if no direct transfer commits.
Succession accept	POST Player takeover action with stale/concurrency protection.

20. Concurrency, Idempotency, and Failure Semantics

Lifecycle mutations are unusually sensitive to stale state because they may change access, authority, or the identity of the shared Voyage. Every mutable operation must therefore use the same expected-sequence/revision and idempotency discipline already required by Helm.

Condition	Required behavior
Same leave/remove/cancel request retried	Return or reconcile the same committed result; do not duplicate terminal events.
Captain removes member while member leaves voluntarily	Exactly one membership terminal transition wins; the other request receives authoritative terminal state.
Transfer and cancellation race	One operation commits under expected revision; the other receives stale/conflict and must not partially apply.
Two takeover requests	One commits Captain authority; all others receive stale/conflict and refetch.
Fork request retried	Return same fork identity when idempotency contract permits; never create duplicate solo Voyages from a single user action.
Client loses response after commit	Refetch by idempotency/correlation and present committed result; do not prompt the user to repeat a destructive action blindly.
Realtime event missed	Polling/refetch restores exact membership, Captain, cancellation, or succession state.
Service unavailable	Fail closed with actionable retry/reconnect copy; never optimistically remove, transfer, cancel, or fork.

21. Privacy, Security, Audit, and Historical Truth

21.1 Authorization

- Player leave and Continue Solo require the authenticated account to own the current Player membership.
- Crew removal, cancellation, transfer, and relinquishment require current server-verified Captain authority for the exact Voyage.
- Take Captaincy requires an eligible current membership and an active succession offer/hold for the exact Voyage.
- Unauthorized Voyage IDs receive safe denial/404 behavior without leaking crew or authority state.
- Cookie-authenticated mutations retain CSRF protection and high-risk rate limits where applicable.

21.2 Privacy

Crew and succession surfaces use profile-safe identity plus operational lifecycle data. They do not expose account emails, raw device identifiers, private reflections, answer text, Creator draft content, or unrelated security/support data.

21.3 Audit and history

- Invitation decline, voluntary leave, removal, cancellation, transfer, relinquishment, takeover, and fork creation are durable audit/lifecycle facts.
- Historical records preserve the identity and role snapshots needed to explain what happened without rewriting old Voyages after profile changes.
- Fork lineage is visible in authorized history but must not expose private state from other Players.
- A cancelled Voyage remains a historical record rather than being deleted.
- Captain transfer history may be consumed later by Wakebook/Admiralty through narrow safe projections; Helm does not create a competing personal-history store.

22. Cross-Project Ownership Boundaries

Adjacent system	Amendment may consume	Amendment must not own
One Voyage	Canonical session lifecycle, committed progression snapshot, fork/clone service, cancellation semantics, event identity.	A second progression engine or shadow runtime state.
Platform / membership	Invitation, membership, presence, access revocation, eligibility.	Account lifecycle or fabricated presence.
Wayfarer / Wakebook	Profile-safe identity, historical projection consumers.	Personal history truth or account/session management.
Lanternwake	Waiting-room join/launch/lifecycle scene contracts and reduced-motion authority.	Animation runtime authority or success truth.
Figurehead	Future avatar embodiment inside semantic crew slots.	Membership, role, presence, readiness, or Captain authority.
Admiralty	Protected escalation/support and possible forced admin repair later.	Ordinary crew lifecycle UI or Captain operations.
Drydock	No direct dependency beyond current Chronicle/readiness contracts.	Authoring validation or simulator semantics.
Tideglass	Possible edition/history links later.	Edition comparison engine.
Bridgewatch	No product dependency.	Development status/telemetry authority.
ONE VOYAGE REMAINS AUTHORITATIVE		
The amendment may request lifecycle changes and forks through canonical services. Helm never becomes the writer of story progression merely because it owns the human-facing Captain experience.		

23. Testing and Acceptance Matrix

Each supplemental increment requires focused development verification, current-main reconciliation, one frozen candidate, one authoritative Sounding Line decision, protected merge binding, and exact-main proof. Automated evidence is necessary but product-facing acceptance must also include a real browser walkthrough of the affected journeys.

Area	Mandatory evidence	Representative hostile / edge cases
Invitation lifecycle	Unit/service + Player browser acceptance.	Double decline, expired/revoked invite, account-required return, stale invite card.
Membership exit/removal	Transaction, authorization, realtime, history tests.	Leave vs remove race, repeated request, unauthorized Captain, active tab revocation.
Cancellation	Lifecycle, multi-device, archive/history, browser proof.	Double cancel, cancel vs launch, stale Captain tab, reconnect after cancellation.
Captain transfer	Authority transaction, projection separation, audit tests.	Transfer to ineligible Player, stale recipient, old Captain tab, Player API privilege leak.
Succession	Concurrency and restart/reconnect proof.	Two simultaneous takers, no eligible Players, all Players leave, stale hold.
Continue Solo	Deterministic fork, privacy, idempotency, lineage proof.	Two forks, retry after lost response, pending write/reconcile, terminal Voyage.
Waiting Room	Desktop/mobile/keyboard/Axe/reduced motion/realtime journeys.	Captain+Player copy, role change during room, join/leave/transfer while open, offline/reconnect.
Cross-project privacy	DTO redaction and Player-safe projection tests.	Captain account uses Player endpoint; fork leaks another Player private data; history reveals admin/security fields.

23.1 Owner walkthrough requirements

- Use at least one Captain+Player account plus two ordinary Player accounts.
- Exercise invitation decline, accept, leave, remove, cancellation, transfer, succession, Continue Solo, and launch from the role-aware Waiting Room.
- Inspect both Captain and Player perspectives after each authority transition.
- Confirm the old shared Voyage and new solo fork histories remain coherent.
- Confirm phone-width and desktop layouts are polished rather than merely technically operable.

24. Revised Mainline Integration Architecture

The Version 1.0 continuous-integration doctrine remains unchanged. The amendment merely adds three more independently accepted delivery boundaries.

Delivery boundary	Primary purpose	Permanent-stop result	Original phase impact
P1 - Take the Helm	Participating Captain foundation.	Authority and membership independent.	Historical original phase.
P2 - Read the Deck	Operational crew/presence projections.	Useful observational Helm even without later work.	Historical original phase.
A1 - Muster the Crew	Membership lifecycle.	Crew can join/decline/leave/be removed/cancel safely.	New amendment boundary.
A2 - Pass the Helm	Captain authority lifecycle and forks.	Shared Voyage can survive Captain departure; solo continuation works.	New amendment boundary.
A3 - Ready the Room	Muster/Waiting Room completion.	Pre-launch social-operational experience is coherent and role-aware.	New amendment boundary.
P3 - Give the Orders	Contextual command console.	Original scope unchanged.	Must begin from A3-accepted main.
P4 - Weather the Passage	Preflight/recovery/degraded modes.	Original scope unchanged.	Exceptional recovery remains here.
P5 - Clear for Voyage	Final closure.	Original scope unchanged.	Final owner-accepted completion.

REVISED PHASE-STACK RULE

P3 is no longer eligible to begin immediately after P2. Under v1.1, P3 requires A1, A2, and A3 to be accepted in protected main first. This is a deliberate governance insertion, not a renumbering of historical phases.

25. Amendment Completion Criteria

The v1.1 amendment is fully realized when all three supplemental increments are accepted into protected main and the original Phase 3 can begin without relying on missing ordinary lifecycle behavior.

- Players can discoverably accept or decline invitations.
- Captain+Player can create a valid Voyage with zero additional invitees.
- Captain has one clear crew/invitation view with actionable lifecycle controls.
- Players can leave an accepted/active Voyage while preserving history.
- Captain can remove a Player with confirmation, audit, and immediate access revocation.
- Captain can cancel the shared Voyage for everyone and produce an archived non-playable record.
- Captain can transfer authority explicitly and atomically.
- Captain can relinquish into a governed succession hold without silently cancelling the Voyage.
- Eligible Players can Take Captaincy; concurrent claims yield one Captain.
- Eligible Players can Continue Solo from the latest committed safe state without mutating the shared Voyage.
- The Waiting Room identifies a participating Captain correctly and allows launch when permitted.
- The Waiting Room presents the crew as an active, polished muster with future Figurehead-ready avatar slots.
- All lifecycle and authority actions are server-authorized, source-bound, idempotent/retry-safe, realtime-reconcilable, privacy-safe, and audited.
- A1, A2, and A3 each entered main independently through current Sounding Line authority and exact-main proof.
- Owner walkthrough accepts the resulting lifecycle and muster experience before Helm Phase 3 begins.

26. Governance, Future Changes, and Final Governing Rule

26.1 Formal amendment effect

This document is a formal governance amendment because it strengthens the Captain authority lifecycle, adds a one-Captain invariant for active shared Voyages, and inserts new mainline delivery boundaries into the approved roadmap. It does not weaken any Version 1.0 privacy, authorization, One Voyage ownership, or Player-safe projection rule.

26.2 Changes requiring another amendment

- Allowing multiple simultaneous active Captains for one shared Voyage.
- Allowing a shared Voyage to continue playable progression with no Captain and no governed succession hold.
- Making Continue Solo mutate or consume the original shared Voyage rather than fork it.
- Automatically assigning Captaincy without an explicit source-bound action or policy.
- Deleting history when Players leave, are removed, or a Voyage is cancelled.
- Moving account suspension or platform administration into ordinary Helm.
- Making Figurehead/avatar presentation authoritative for presence or membership.
- Removing A1-A3 from the mainline dependency sequence without an explicit superseding governance decision.

26.3 Final Governing Rule

FINAL GOVERNING RULE

A Voyage crew must be able to form, change, separate, continue, and end without ambiguous authority or lost history. Captaincy is explicit and transferable; Player membership is independent; cancellation ends the shared Voyage; relinquishment seeks succession; solo continuation forks safely; and the Waiting Room tells the truth about who is actually aboard. The Dutchman may be fictional. The invariant is not.

Appendix A. Lifecycle State Matrix

Situation	Shared Voyage	Player membership	Captain authority
Invitation declined	Unchanged	Not created / terminal invitation only	Unchanged
Player voluntarily leaves	Continues if governance permits	Terminal LEFT/DEPARTED equivalent, history retained	Unchanged unless same person is Captain; then ordinary leave is blocked pending transfer/relinquish
Captain removes Player	Continues	Terminal REMOVED equivalent, history retained	Unchanged
Captain cancels Voyage	CANCELLED / archived / non-playable	Historical memberships retained; active access ends	Authority no longer operational because Voyage terminal
Direct transfer	Continues	Both memberships unchanged	Old ends exactly as new commits
Captain relinquishes without successor	CAPTAIN_REQUIRED / succession hold	Memberships unchanged	Vacant until takeover commits
Player takes Captaincy	Continues	Membership unchanged	Player gains Captain authority
Player continues solo	Original unchanged; new personal fork created	Original membership unchanged unless separately left; new membership created	New fork assigns requester Captain authority

Appendix B. Representative API Surface

These names are illustrative contracts, not mandatory route spelling. Codex should reconcile current source and use the repository's canonical naming conventions.

Purpose	Illustrative endpoint	Key safeguards
Decline invitation	POST /api/invitations/:id/decline	Recipient auth, CSRF, idempotency, terminal-state conflict handling
Leave Voyage	POST /api/player/playthroughs/:id/leave	Membership ownership, Captain-authority guard, expected revision
Continue Solo	POST /api/player/playthroughs/:id/continue-solo	Membership ownership, source sequence binding, idempotency, privacy-safe clone
Crew projection	GET /api/captain/playthroughs/:id/crew	Captain authority, explicit DTO, no raw account/device data
Remove member	POST /api/captain/playthroughs/:id/crew/:membershipId/remove	Captain authority, consequence confirmation client-side, expected revision/idempotency
Cancel Voyage	POST /api/captain/playthroughs/:id/cancel	High-risk confirmation, lifecycle policy, stale-state conflict
Transfer Captain	POST /api/captain/playthroughs/:id/captain/transfer	Eligibility, atomic authority swap, audit
Relinquish Captain	POST /api/captain/playthroughs/:id/captain/relinquish	Authority check, direct-transfer preference, succession hold
Take Captaincy	POST /api/player/playthroughs/:id/captain/takeover	Eligible membership, active succession, first-commit-wins

Appendix C. Acceptance Checklist

- ☐ v1.0 governing document remains preserved and separately identifiable.
- ☐ Amendment v1.1 is indexed as a formal Project Helm governing source.
- ☐ A1 begins from current accepted main after Phase 2 and no stacked branch is used.
- ☐ Invitation decline is discoverable from ordinary Player navigation.
- ☐ Zero-invite Captain+Player creation is valid.
- ☐ Unified crew/invitations view distinguishes relationship, membership, presence, readiness, Captain identity, and actions.
- ☐ Player Leave Voyage is canonical and distinct from navigation.
- ☐ Captain removal and cancellation are confirmed, audited, idempotent, and realtime-reconciled.
- ☐ A2 begins only after A1 is accepted in main.
- ☐ Direct Captain transfer is atomic and Player-safe.
- ☐ Relinquishment enters governed succession rather than ambiguous no-Captain play.
- ☐ Concurrent takeover produces exactly one Captain.
- ☐ Continue Solo creates a new source-bound Voyage and does not mutate the shared Voyage.
- ☐ A3 begins only after A2 is accepted in main.
- ☐ Waiting Room shows role-aware copy and launch controls for Captain+Player.
- ☐ Crew muster is polished on desktop and phone with keyboard, zoom, reduced-motion, and screen-reader evidence.
- ☐ Figurehead-ready slots remain presentation-only and fail safely.
- ☐ All three supplemental increments have focused qualification, authoritative Sounding Line RELEASE_GO, protected binding, merge, and exact-main proof.
- ☐ Owner walkthrough accepts the complete amendment plateau.
- ☐ Only then may original Helm Phase 3 - Give the Orders begin.
