

PROJECT CONFLUENCE

The Living Developer Journal System

Governing Architecture and Product Requirements Document

◆ Governing Principle

Human and engineering truth must meet before narrative begins.

Project Confluence preserves two independent evidence streams - what the software demonstrably did and what the developer demonstrably thought, felt, changed, questioned, and learned - then entrusts final authorship to a separate synthesis step. The weekly journal is never a prewritten template filled with facts. Its meaning and structure must be discovered from the week itself.

Version 1.0 • August 17, 2026

Prepared for the Voyagewright project

Document Control

Field	Value
Program	Project Confluence
Subsystem	The Living Developer Journal System
Document type	Governing architecture and product requirements
Version	1.0
Date	August 17, 2026
Status	Governing baseline
Primary repositories	Kgray44/voyagewright-journal-archive (private evidence/master archive); Kgray44/treasurehuntSoT (publish-safe Developer_Journals mirror)
Primary automation actors	ChatGPT human-evidence collectors; Codex engineering collector; ChatGPT master author; Codex delivery worker
Canonical literary precedent	Voyagewright Developer Journal - The Compass Points Home, Expanded Edition (37 pages)
Core implementation rule	One fixed journal design grammar; zero prewritten weekly prose or narrative structure

1. Executive Summary

A weekly record of both what was built and what it was like to build it

Project Confluence establishes a durable developer-journal system for Voyagewright. Its purpose is not merely to summarize work. It exists to preserve the engineering record, the human record, and the relationship between them while the project is still alive enough for those details to be known.

The system uses two intentionally separate evidence streams. ChatGPT captures the human side of the week from project conversations: motivations, frustrations, excitement, uncertainty, changing opinions, questions, decisions, realizations, personal meaning, and the moments that altered direction. Codex captures the engineering side from the repositories and their accepted records: commits, pull requests, phases, validation, metrics, architecture, migrations, releases, and current source truth. Neither stream substitutes for the other.

Once both packets exist, ChatGPT becomes the master author. It does not fill a standard weekly template. It first studies the evidence, determines what the week was actually about, evaluates several plausible themes, and then designs the title, structure, pacing, chronology, emphasis, opening, and ending from that week alone. The final journal must feel authored rather than assembled.

The publication itself follows a different rule: its visual grammar is stable. The weekly documents must remain visibly members of the same developer-journal family established by the 37-page expanded edition of The Compass Points Home. Page geometry, typography, colors, spacing rhythm, borders, header/footer placement, table language, pull-quote treatment, and other design-system properties remain consistent. Page count, section count, section titles, narrative architecture, and content placement adapt to the material.

The private repository is the complete historical archive. It stores daily and weekly human evidence, weekly engineering evidence, synthesis records, source manifests, private master journals, and publication-safety records. The public Voyagewright repository receives only publish-safe finished journals under `Developer_Journals/`.

The architecture also treats retroactive generation as a first-class capability. A one-time replay can look back over a bounded prior period, backfill missing evidence, run the same synthesis and authoring pipeline, validate the resulting journal, and either retain it as a test artifact or promote it into the canonical archive. This makes the system testable today and useful whenever a past week needs to be reconstructed later.

Two factual streams converge; authoring remains separate from collection and publishing.

Figure 1. Project Confluence separates collection, interpretation, authorship, and publishing.

2. Project Identity and Purpose

Why this subsystem is called Confluence

The program is named Project Confluence. A confluence is the place where independent currents meet and continue as one stream. That is the exact architecture of this system: one current carries engineering truth; the other carries human truth. The weekly journal begins only after both arrive.

Project name

PROJECT CONFLUENCE
The Living Developer Journal System

Primary product outcome

Every completed week of Voyagewright development can become a carefully authored historical journal that explains not only what happened but why it mattered, what it felt like, how understanding changed, and how the week fits into the longer story of the project.

Secondary outcomes

- Preserve human thought and project meaning before hindsight flattens it into a clean final narrative.
- Create an evidence-backed historical record useful to the developer years later.
- Make engineering metrics legible as story evidence without turning the journal into a weekly status report.
- Protect candid human source material in a private archive while allowing a publish-safe finished journal to live with the project.
- Allow the journal system itself to be tested through deterministic retroactive replays.

3. Governing Principles

Rules that may not be traded away for convenience

Two truths before one story

Human evidence and engineering evidence remain separately sourced and separately attributable until synthesis. The journal may combine them narratively, but provenance must remain reconstructable.

Evidence before interpretation

The system may infer a weekly theme only from supported evidence. It may not invent the developer's emotional state or quietly transform an engineering event into a personal belief.

No prewritten weekly prose

No title, subtitle, thesis, opening, ending, section name, section count, narrative arc, or recurring paragraph may be chosen before the week is studied.

Stable visual grammar, free composition

Every journal uses the same design philosophy and layout language. That consistency must never hard-code the week's story structure.

Private raw history, publish-safe finished work

Raw human evidence remains private. The main repository receives only the completed journal after publication review.

Replay is legitimate

Retroactive runs are first-class, evidence-bound operations rather than unofficial emergency scripts.

Do not flatten change over time

When the developer changes their mind, becomes frustrated, becomes excited, or revises an interpretation, the system should preserve that evolution rather than report only the final conclusion.

Automation may collect; authorship stays deliberate

Collection and delivery can be mechanical. The master journal must remain a careful act of synthesis and writing.

No fake completeness

Missing source coverage must be recorded as missing. The journal should write around gaps rather than fabricate a plausible week.

The archive is historical infrastructure

Outputs are versioned, checksummed, provenance-bound, and never casually overwritten.

4. System Roles and Authority Boundaries

Each actor owns one kind of work

Actor	Owns	Must not own
ChatGPT Daily Human Collector	Best-effort daily project-chat micro-captures; emotional and reasoning context	Repository engineering truth; project documents; final journal authorship
ChatGPT Weekly Human Collector	Weekly human evidence synthesis and chronology	GitHub/repository facts used to fill gaps; finished journal
Codex Weekly Engineering Collector	Repository/GitHub facts, technical progress, metrics, validation, accepted source truth	Invented personal meaning; final literary interpretation
ChatGPT Master Author	Theme selection, narrative architecture, complete journal writing, private master DOCX/PDF	Engineering facts not present in evidence; templated prose; public-repo mechanics
Codex Delivery Worker	Mechanical validation, checksums, archive/mirror delivery, index updates and PR mechanics	Rewriting titles, reflections, conclusions, or any journal prose
Human owner	Final product authority, manual on-demand runs, privacy decisions, future style amendments	Routine automation steps once governed and safe

Critical separation

Codex is the engineering witness and publication courier. ChatGPT is the human-context witness and final author. No worker may silently expand its authority because another source is inconvenient.

5. End-to-End Architecture

From a week of work to a lasting historical record

Two factual streams converge; authoring remains separate from collection and publishing.

Figure 2. The dual-observer pipeline and separated authorship boundary.

Canonical weekly sequence

1. Daily ChatGPT micro-captures preserve the volatile human context of each day.
2. After the week closes, ChatGPT produces one weekly human-evidence packet.
3. Codex independently produces the weekly engineering-evidence packet.
4. ChatGPT reads both packets, performs theme competition, and produces a narrative design record.
5. ChatGPT authors the private master journal from scratch using the fixed journal design grammar.
6. The journal is rendered, visually inspected, structurally validated, and source-manifested.
7. A publication-safety pass determines whether the public edition can be identical or requires narrow redaction.
8. Codex mechanically archives the master and mirrors the publish-safe final journal to Developer_Journals/ in the main repository.

Default cadence

Approx. time (America/New_York)	Operation	Owner
Daily, ~1:00 AM	Previous-day human micro-capture	ChatGPT
Monday, ~2:30 AM	Previous Monday-Sunday human synthesis	ChatGPT
Monday, ~3:15 AM	Previous Monday-Sunday engineering evidence sweep	Codex
Monday, ~4:30 AM	Theme analysis + private master journal authoring	ChatGPT
Monday, ~5:45 AM	Validation, archive delivery, publish-safe mirror candidate	Codex

These times are operational defaults, not narrative requirements. The pipeline must tolerate delayed workers, retries, and on-demand invocation without changing the covered date range.

6. Human Evidence Stream

Preserve the person that Git cannot see

The human evidence stream exists because accepted engineering records naturally erase many of the details that make development history worth reading. A pull request can record that a fix landed. It cannot reliably preserve the fact that the developer changed their mind three times, discovered the deeper problem during a frustrated walkthrough, connected that problem to a relationship or philosophical idea, or felt a breakthrough restore momentum after a miserable afternoon.

Allowed evidence

- Project-chat user messages and assistant context necessary to understand them.
- Conversation titles and timestamps when available.
- Daily human micro-captures generated from those project chats.
- Explicit developer statements about intentions, emotions, doubts, decisions, frustrations, excitement, hopes and changes in understanding.

Forbidden evidence for human backfill

- Uploaded governing documents.
- Repository files or project documents.
- GitHub engineering evidence.
- Codex reports and completion records.
- External web sources used to guess what the developer must have felt.

Required categories

Category	Examples of what belongs
Motivation	Why a task mattered; what the developer hoped would improve
Frustration	What felt wasteful, blocked, repetitive, disappointing or absurd
Excitement	Breakthroughs, unexpectedly good outcomes, moments of renewed momentum
Changing opinion	Initial belief -> new evidence -> revised belief
Design reasoning	Why one architecture or experience direction became preferable
Personal meaning	Connections to Sera, presence, memory, school/work pressure, or broader purpose when explicitly discussed
Unresolved thought	Ideas still in motion; questions not yet answered
Memorable moment	A conversation, discovery, bug, joke, or turning point likely worth preserving

Truth rule

Do not invent the inner life

If the source says the developer was frustrated, that may be written as frustration. If the source only shows that a test failed, the system may not upgrade that into anger, despair, determination, or any other emotional claim.

7. Engineering Evidence Stream

Let the repository remember what actually happened

The engineering stream is the factual counterweight to the human record. It is collected independently so the final journal can distinguish between what the week felt like and what the repository can prove happened.

Preferred sources

- Git commits and exact mainline boundaries.
- Merged and active pull requests.
- Phase or increment acceptance records.
- Sounding Line evidence and release decisions.
- Test counts, failure/root-cause summaries and notable performance measurements.
- Migrations, tags, release records, dependency or repository growth when useful.
- Project status and accepted machine-readable evidence.
- Important source changes whose meaning is supported by current repository truth.

Engineering packet contents

Field family	Purpose
Period identity	Exact start/end, timezone, main SHA at beginning/end
Project movement	Projects/phases started, completed, merged, paused or blocked
Change evidence	Commits, PRs, changed areas, migrations, major architectural moves
Verification	Tests, acceptance gates, failures, re-runs, performance or throughput observations
Repository scale	Selected metrics when historically meaningful
Unresolved engineering state	Open blockers or risky changes that remain at week close
Source manifest	Stable links/IDs/digests sufficient to audit the packet

The engineering collector should prefer compact accepted summaries and machine-readable project/status records over repeatedly rereading full governing documents. It may inspect source details when necessary to describe a meaningful event accurately.

8. Evidence Normalization and Provenance

Keep the sources boring so the writing can be alive

Every synthesis run must be traceable to exact evidence artifacts. The journal is literary, but its factual substrate is not casual.

Canonical evidence envelope

Field	Meaning
period	Bounded start/end timestamps and timezone
stream	human or engineering
coverage	best-effort, exact, partial or blocked
sourceItems	Chat titles/IDs or repository/PR/commit identifiers
events	Normalized facts or developer statements
uncertainties	Known gaps or conflicts
generatedAt	Collector time
collectorVersion	Task/skill version
digest	Content checksum used by the synthesis manifest

Contradiction policy

When sources disagree, the system does not silently reconcile them. The synthesis record should identify the disagreement and resolve it only when one source has clear authority. A later user reflection may supersede an earlier user opinion, but the journal may choose to narrate the change rather than erase the earlier belief.

No provenance theater

The final journal does not need citation markers in every paragraph. It needs a source/provenance appendix or manifest capable of reconstructing the factual foundation without making the prose read like a lab report.

9. Theme-First Synthesis

The journal must discover its story

The synthesis step exists to stop the automation from turning rich evidence into a chronologically sorted changelog. Before any journal prose is written, ChatGPT must interpret the week at a higher level.

Theme competition

- Generate several plausible interpretations of what the week was about.
- For each candidate, evaluate human-evidence strength, engineering-evidence strength, temporal recurrence, emotional significance, project consequence, and narrative coherence.
- Reject themes supported only by one dramatic event when the rest of the week points elsewhere, unless that event genuinely dominated the period.
- Select one dominant interpretation or, rarely, a deliberate dual-theme structure when the evidence proves the week was defined by tension between two inseparable ideas.
- Preserve the theme analysis privately but do not force the final journal to expose its scoring machinery.

Narrative design freedom

After selecting the theme, ChatGPT may choose chronological narration, reverse chronology, braided technical/personal sections, one dominant event with supporting sidebars, a question-driven structure, a multi-act structure, or another form justified by the evidence. No previous week's organization is authoritative.

Absolute rule

The system may standardize visual grammar and provenance. It may not standardize the week's meaning.

10. Master Journal Authoring Authority

ChatGPT writes every sentence

The private master journal is authored by ChatGPT after both evidence streams and the synthesis record are complete. This is a deliberate authority boundary. Codex may never rewrite, simplify, summarize, normalize, retitle, or editorially "improve" the master journal.

Required literary qualities

- First-person personal engineering memoir when the evidence supports first-person reflection.
- Technically literate and precise when engineering detail matters.
- Reflective without forced sentimentality.
- Humor that grows naturally from the events rather than being injected on a schedule.
- Comfort moving between concrete work and larger meaning.
- Metrics used as evidence of scale or consequence, never as the emotional center by default.
- Willingness to preserve frustration, uncertainty and unfinished thinking when that is historically truthful.
- No obligation to make every week sound profound. Some weeks are allowed to be practical, funny, difficult, quiet, or strange.

Forbidden authoring behaviors

- Reusing last week's section titles because they fit the template.
- Opening every issue with the same reflective sentence structure.
- Forcing a moral lesson when the evidence does not support one.
- Inventing conversations, emotions, motives or memories.
- Turning the journal into a completion report with decorative personal paragraphs.
- Letting project metrics crowd out the person who experienced the week.
- Treating the 37-page reference journal as a text template rather than a design and quality precedent.

11. Invariant Journal Design Philosophy

One publication family, not one repeated page layout

The journals must look as though they belong to the same publication every week. This requirement is stronger than “similar colors.” The design system is a persistent grammar governing page geometry, typography, spacing, borders, tables, pull quotes, running matter, color, and editorial rhythm. It is not permission to copy the content architecture of The Compass Points Home.

The journals must look like one publication family without becoming one repeated template.

Figure 3. Design invariance is strict; narrative composition remains free.

Fixed design grammar

- Page size and canonical margin system.
- Font families, font weights, hierarchy and body-text measure.
- Deep teal primary headings; warm gold accent marks; cream editorial accents; restrained gray running matter.
- Gold diamond separator language used consistently and sparingly.
- Running header position, running footer position, date/privacy line position and page-number position.
- Border thicknesses, table line language, table header style and alternating editorial row treatment.
- Paragraph spacing, heading spacing, line spacing, widow/orphan treatment and white-space rhythm.
- Pull-quote typography, alignment, maximum width and spacing behavior.
- Source-note, caption and appendix styling.
- Image placement rules and caption treatment when images are used.

- Accessibility requirements for contrast, reading order, headings and tables.

Flexible composition

- Total page count.
- Whether a contents page is useful.
- Number and names of sections.
- Exact section lengths.
- Whether a week contains tables, figures, appendices, pull quotes or none of them.
- Narrative order and chronology.
- Where page breaks fall as the content naturally flows.
- The exact cover title/subtitle and thematic statement.
- The balance between engineering detail and personal reflection.

Reference precedent

The canonical visual/literary precedent is the 37-page expanded edition of The Compass Points Home. Its centered running header, teal display headings, warm gold diamonds, restrained cream table bands, serif long-form editorial voice, gray footer/date treatment, and spacious page rhythm establish the family. A later design specification will capture exact fonts, colors, measurements and component rules from the reference so automation can reproduce them reliably.

Design invariant

Future journals may look different because the material flows differently. They must not look as though a different magazine redesigned the system each Monday.

12. Repository and Storage Architecture

Private black box, publish-safe public bookshelf

Private archive

Kgray44/voyagewright-journal-archive is the complete historical source archive and MUST be private before any human evidence is written to it.

Path	Contents
human/daily/<year>/<date>/	Daily human.json + human.md
human/weekly/<year>/<week>/	Weekly human.json + human.md
engineering/weekly/<year>/<week>/	Weekly codex.json + codex.md
synthesis/<year>/<week>/	theme-analysis.json + narrative-outline.md + source-manifest.json
journals/<year>/<week>/	Private master DOCX + PDF + metadata + publish-safety assessment
references/	Journal visual design specification and non-prose style references
replays/<run-id>/	Noncanonical retroactive test runs, manifests and comparison artifacts

Main repository mirror

Kgray44/treasurehuntSoT receives only publish-safe finished journals. The canonical destination is Developer_Journals/<year>/<week>/. Raw human records, theme analyses, detailed source manifests and private-only master variants do not enter the public repository.

Main-repo path	Permitted content
Developer_Journals/README.md	Index, explanation and journal catalog

Main-repo path	Permitted content
Developer_Journals/<year>/<week>/*.pdf	Publish-safe finished journal PDF
Developer_Journals/<year>/<week>/*.docx	Publish-safe editable journal when approved
Developer_Journals/<year>/<week>/metadata.json	Non-sensitive title/date/checksum/source-edition metadata only

Current safety requirement

The archive repository must be verified PRIVATE before raw human evidence or private master journals are written. If visibility is public or cannot be verified, collectors and authoring workers must fail closed.

13. Scheduling and Orchestration

A weekly ritual that can survive retries and delays

Schedule identity

All weekly operations must calculate their covered period explicitly in America/New_York. The canonical scheduled weekly period is Monday 00:00:00 through Sunday 23:59:59 local time. A worker that runs late must still cover the same period rather than drifting forward.

Dependency gates

- The master author waits for both weekly evidence packets.
- The delivery worker waits for a validated private master and publish-safety assessment.
- A failed daily human capture does not block the week if the weekly collector can recover adequate project-chat coverage; the missing daily record remains visible in coverage metadata.
- A failed engineering collector blocks master authoring when no equivalent weekly engineering packet exists.
- A worker retry is idempotent for the same period and input digests.

Manual trigger parity

Every scheduled operation must also have an explicit manual/on-demand invocation that uses the same core implementation and produces the same evidence schema. Scheduled jobs must never be the only way to use the system.

14. Retroactive and On-Demand Journal Runs

Reconstruct a week without waiting for Monday

Project Confluence defines a first-class Replay Run for testing, recovery and intentional historical generation. This is one of the system's most important usability requirements: the owner should be able to say "create a journal for the last seven days" and exercise the complete pipeline without waiting for the next scheduled cycle.

Replay mode is a first-class path, not an emergency workaround.

It backfills missing evidence, uses the normal synthesis/authoring path, then preserves or promotes the result.

Figure 4. The Replay Run backfills missing evidence and then uses the normal pipeline.

Default replay behavior

- Accept an explicit start/end period, or default to the rolling previous seven days ending at invocation time.
- Check whether canonical daily/weekly human and engineering evidence already exists for the requested period.
- Reuse existing evidence when its period and digests match.
- Backfill only missing evidence streams using the same source rules as the scheduled collectors.
- Run theme competition and master authoring exactly as the scheduled path does.
- Render and validate DOCX/PDF outputs.
- Default to private replay output under `replays/<run-id>/` until the owner or promotion rule marks it canonical.
- Optionally create a publish-safe mirror candidate after a successful replay.

Easy one-time test command

Conceptual command

```
journal replay --last-7-days
```

The detailed implementation prompt may choose a repository-standard `npm/script/CLI` form, but the user-facing operation must remain this simple in spirit.

Collision policy

If canonical evidence or a canonical journal already exists for the same period, replay does not overwrite it silently. The run receives a unique run ID and may compare against or be promoted over the prior output only through an explicit operation. Historical journals are records, not mutable dashboards.

Test usefulness

Replay mode is also the primary end-to-end qualification mechanism for initial Project Confluence rollout. A retroactive seven-day run can test evidence recovery, synthesis, authoring, rendering, private archival, publication safety, and delivery before the first naturally scheduled week completes.

15. Privacy, Publication, and Redaction

Preserve candor without publishing it by accident

Human evidence is expected to contain candid personal material. That is a feature of the archive, not an excuse to expose it. The private archive and public journal mirror therefore have different trust boundaries.

Private master

- May contain personal reflections supported by the human evidence.
- May mention relationship context, frustrations, work/school pressures and private motivations when appropriate to the journal.
- Must still exclude secrets, credentials, unrelated private third-party information, and material the evidence rules prohibit.
- Is retained in the private repository as the complete authored historical edition.

Public mirror

- Receives only the finished publish-safe journal.
- Must pass credential/secret scanning and a human-privacy review policy.
- May be identical to the master when no sensitive material needs redaction.
- If redaction is necessary, the master remains intact and the public edition records that it is a publish-safe derivative.
- Never publishes raw human evidence, daily captures or detailed theme-analysis artifacts.

Personal data minimization

The system is a developer journal, not a surveillance product. It should preserve meaningful personal context, not maximize collection. Daily collectors should summarize rather than duplicate entire chat transcripts.

16. Failure, Recovery, and Idempotency

The journal must fail honestly

Failure classes

Failure	Required behavior
Archive repository not private	Block every raw human/master write; preserve task output elsewhere if possible
Missing weekly human packet	Attempt governed backfill; otherwise block master journal
Missing weekly engineering packet	Attempt governed engineering replay; otherwise block master journal
Evidence coverage partial	Record coverage; author only where safe; block only if meaningfully insufficient
Theme synthesis uncertainty	Prefer a modest truthful frame over a dramatic invented thesis
DOCX render defect	Repair and rerender before completion
PDF structural defect	Repair or reconvert before completion
Public-safety finding	Keep private master; create blocked or minimally redacted public derivative
Delivery failure	Do not regenerate prose; retry mechanical delivery against the same master digests
Repeated same-period invocation	Return/reuse existing canonical artifacts or create a versioned replay; never silently overwrite

Recovery rule

Do not rewrite because delivery failed

Once the private master is finalized and checksummed, downstream mechanical failures must not cause the journal to be re-authored. Retry the delivery from the same immutable master.

17. Validation and Acceptance

A beautiful journal is still an artifact that must be verified

Evidence validation

- Both weekly evidence streams present or their absence explicitly governed.
- Period identities match.
- Source manifests identify the inputs actually used.
- No human claim is unsupported by the human evidence.
- No engineering claim is unsupported by engineering evidence.
- Contradictions and gaps are not silently erased.

Document validation

- DOCX renders successfully to page images.
- Every page is visually inspected for clipping, overflow, bad page breaks, missing glyphs, broken tables, or header/footer drift.
- PDF preflight passes.
- Page numbers and running matter are correct.
- Typography, color and spacing comply with the fixed design grammar.
- No weekly design experimentation violates the journal family identity.
- Accessibility and reading order remain reasonable for the artifact format.

Narrative validation

- No preselected template language is visible.
- The title and structure are supported by the week's evidence.
- The entry is a coherent piece of writing rather than a bullet-expanded status report.
- Technical specificity is correct where used.
- Personal interpretation is bounded by what the developer actually said or clearly expressed.
- The conclusion is earned by the week rather than inserted because every journal is expected to sound profound.

18. Implementation Roadmap

Build the system in small governed increments

Increment	Name	Primary outcome	Mainline-safe plateau
C0	Name the Currents	Governing document + architecture + private/public boundaries	No runtime behavior changed
C1	Set the Type	Small design specification captures exact journal design grammar from the 37-page precedent	Design authority exists; no automation required
C2	Build the Archive	Create canonical file trees, schemas, indexes and privacy guards in both repositories	Repositories ready for data
C3	Gather the Week	Codex engineering collector + compatible manual replay evidence collection	Engineering evidence can be produced independently
C4	Find the Story	Theme analysis + ChatGPT master author orchestration using human + engineering packets	Private master can be produced on demand

Increment	Name	Primary outcome	Mainline-safe plateau
C5	Carry the Pages	Codex validation/delivery worker + private archive + publish-safe public mirror	End-to-end manual flow complete
C6	Keep the Watch	Schedule both Codex workers and integrate with existing ChatGPT tasks	Weekly unattended operation
C7	Prove the Past	One complete retroactive seven-day replay and comparison run	System proven before first natural weekly cycle

The detailed Codex setup prompt requested after the design specification should implement the repository machinery, the two Codex scheduled workers, the file trees, the replay path, validation, and public/private delivery without taking editorial control away from ChatGPT.

19. Future Growth and Extensions

Useful later, unnecessary now

- Quarterly and annual collected editions synthesized from completed weekly journals.
- A visual timeline/index of weekly titles, themes and project milestones.
- Daily micro-capture quality metrics to learn which context is routinely missing from weekly synthesis.
- Optional manual annotations added by the developer before a week is finalized.
- Journal cross-links to releases, screenshots or selected safe project artifacts.
- Long-term archive export independent of GitHub.
- A future private search experience across journals, evidence packets and theme analyses.
- Optional publication channels beyond the main repository, governed by the same publish-safe derivative rule.

None of these are prerequisites for the first weekly journal. Project Confluence should become useful before becoming elaborate.

20. Final Acceptance Criteria

When Project Confluence may be called real

1. The private journal archive is verified private before raw human evidence is written.
2. The main Voyagewright repository contains a governed Developer_Journals destination for publish-safe final journals.
3. Daily and weekly ChatGPT human evidence capture operates with project-chat-only sourcing.
4. The Codex engineering collector can generate one bounded weekly engineering packet without inventing personal interpretation.
5. Theme selection occurs before prose and considers multiple plausible interpretations.
6. The master author creates a journal with no prewritten title, thesis, section structure, opening, ending or page target.
7. The journal design specification enforces the same overall design philosophy as the 37-page expanded Compass Points Home reference.
8. The fixed design grammar remains stable while page count and narrative composition are free.
9. DOCX and PDF outputs render cleanly and pass visual/structural QA.
10. The private master is archived with source/digest metadata.
11. The public mirror contains only publish-safe final artifacts.
12. Codex delivery cannot rewrite journal prose.
13. An on-demand rolling seven-day Replay Run can generate a complete journal when canonical evidence is absent.
14. Replay is idempotent and does not silently overwrite historical journals.

- 15. At least one retroactive end-to-end run is successfully completed before relying on the natural weekly schedule.

Final governing rule

Project Confluence exists to remember the week before hindsight cleans it up. The archive must preserve truth, the design must preserve identity, and the writing must remain free enough to discover a different story every time.

Appendix A. Design Invariance Matrix

Design element	Invariant?	Rule
Page size / margins	YES	Exact values frozen by design specification and reused every week
Font families	YES	Same families and role hierarchy every week
Core colors	YES	Same teal/gold/cream/gray system
Running header/footer	YES	Same positions, typographic roles and baseline spacing
Border/rule language	YES	Same line weights, colors and usage logic
Body line length / spacing rhythm	YES	Same editorial measure and vertical rhythm
Tables	YES - when used	Same header, border and alternating-row language
Pull quotes	YES - when used	Same typography and spacing family
Cover narrative text	NO	Written uniquely from that week
Contents page	NO	Exists only when useful
Section names/count	NO	Derived from evidence
Page count	NO	Derived from content
Figures/tables presence	NO	Use only when the story benefits
Opening / closing devices	NO	Never templated

Appendix B. Recommended Evidence File Names

The detailed implementation may adjust exact filenames if repository conventions require it, but semantic roles should remain stable.

```

Appendix C. Replay Run Contract

Input	Default / rule
Period	Explicit start/end or rolling previous seven days
Timezone	America/New_York unless explicitly overridden
Existing evidence	Reuse when exact; backfill only missing streams
Existing canonical journal	Never overwrite silently
Output	Private replay run first; optional promotion
Author	Same ChatGPT master-author path as scheduled journal
Design	Same fixed design specification
Public mirror	Optional after publish safety
Purpose	Initial E2E test, recovery, historical backfill, ad hoc past-week journal

Appendix D. Source and Precedent Notes

Project Confluence was defined from the August 17, 2026 architecture discussion about automated weekly Voyagewright developer journals, the already-established ChatGPT daily/weekly human-context tasks, the proposed two-worker Codex collection/delivery model, and the requirement that ChatGPT retain final authorship.

Its canonical journal precedent is Voyagewright Developer Journal - The Compass Points Home, Expanded Edition, a 37-page private project journal dated August 15, 2026. That reference establishes the intended quality level and the visual/editorial family, including teal headings, gold diamond motifs, cream editorial table bands, a restrained running header/footer, serif long-form treatment, spacious page composition, quantitative evidence used narratively, and first-person movement between engineering and personal reflection.

This governing document intentionally does not freeze exact weekly prose, titles, chapter structures, or page count. Those would contradict Project Confluence's central authoring rule. Exact reusable visual measurements belong in the separate design specification requested as the next artifact.

Two currents meet. One story remains.
